DETAILED PRODUCT DESCRIPTION

The H Series is a line of compact, high-reliability, regulated high voltage power supplies capable of delivering 15W of continuous power at maximum output voltages ranging from 300V up to 10,000V.

H Series models are programmable from 0 to 100% of rated output voltage via a 0 to 5 volt DAC-compatible high impedance input programming pin. A 0 to 5 volt output voltage monitor is provided. The H Series operates from a 24V input. The product line has input reverse-polarity protection. It also has output short-circuit and arc protection. An aluminum enclosure aids in EMI/RFI reduction. An externally accessible potentiometer provides adjustable gain trim allowing for individual calibration of units. A proprietary encapsulation process and a custom 94V-0 listed, high performance potting compound are used to achieve excellent high voltage and thermal properties. Standard models come in either positive or negative polarity.

- * Notes:
1. At Maximum Rated Output Voltage.
 2. Specifications after 1 hour warm-up, full load, at 25°C unless otherwise indicated.
 3. Typical Performance.
 4. Proper thermal management techniques are required to maintain safe case temperature at maximum power output.
 5. SET POINT ACCURACY refers to the ability of the unit to accurately deliver the voltage intended by the applied programming. The resultant output voltage will be within +/-1% of that programmed.
GAIN ADJUSTMENT refers to the ability to alter the gain of the circuit to bring the resultant output voltage to the programmed set point. This is intended to allow compensation for set point accuracy error.
LINEARITY refers to how much the transfer function can deviate from a straight line in the absence of any set point error.
